1 Introduction

The HWT905 is a multi-sensor device detecting acceleration, angular velocity, angle as well as magnetic field. The robust housing and the small outline makes it perfectly suitable for industrial retrofit applications such as condition monitoring and predictive maintenance. Configuring the device enables the customer to address a broad variety of use cases by interpreting the sensor data by smart algorithms.

HWT905's scientific name is AHRS IMU sensor. A sensor measures 3-axis angle, angular velocity, acceleration, magnetic field. Its strength lies in the algorithm which can calculate three-axis angle accurately.

HWT905 offers several advantages over competing sensor:

- Heated for best data availability: new WITMOTION patented zero-bias automatic detection calibration algorithm outperforms traditional accelerometer sensor
- High precision Roll Pitch Yaw (X Y Z axis) Acceleration + Angular Velocity + Angle + Magnetic Field output
- Low cost of ownership: remote diagnostics and lifetime technical support by WITMOTION service team
- Developed tutorial: providing manual, datasheet, Demo video, free software for Windows computer, APP for Android smartphones , and sample code for MCU integration including 51 serial, STM32, Arduino, Matlab, Raspberry Pi, communication protocol for project development
- WITMOTION sensors have been praised by thousands of engineers as a recommended attitude measurement solution

1.1 Warning Statement

- Putting more than 36 Volt across the sensor wiring of the main power supply can lead to permanent damage to the sensor.
- VCC cannot connect with GND directly, otherwise it will lead to the burning of the circuit board.
- For proper instrument grounding: use WITMOTION with its original factory-made cable or accessories.
- Do not access the I2C interface.
- For secondary developing project or integration: use WITMOTION with its compiled sample code.

2 Use Instructions with PC

2.1 Connection Method

PC software is only compatible with Windows system.

[Link to HWT905's demo video](#)

2.1.1 Serial Connection

Step 1. Connect the sensor with a serial converter

PIN Connection:

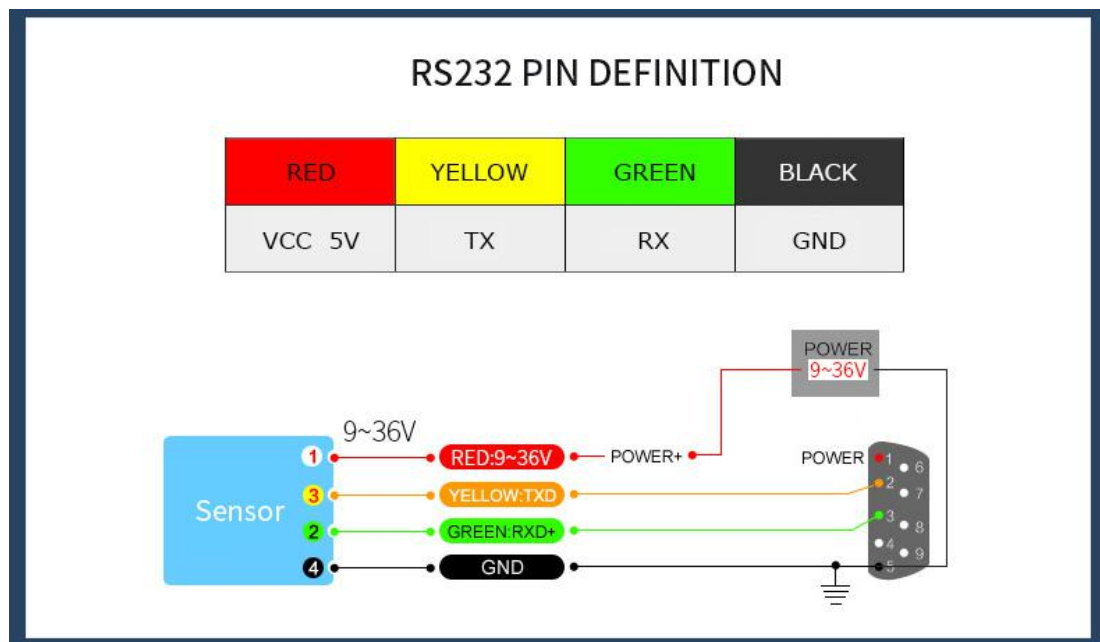

VCC - 9~36V

TX - Yellow

RX - Green

GND - GND

(When connecting with computer, VCC-9~36V is recommended.)

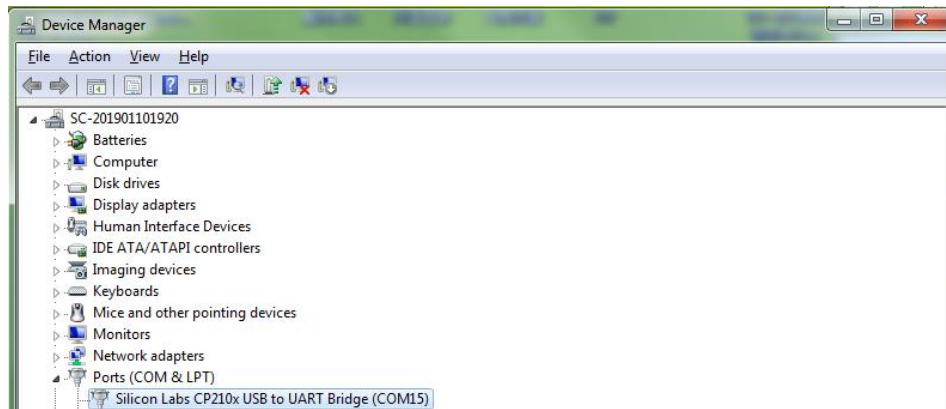

Recommended tools:

[Link to tutorial of 3-in-1 serial converter\(CH340 driver\)](#)

[Link to tutorial of 6-in-1 serial converter \(CP2102 driver\)](#)

Step 1. Unzip the software and install the driver CH340 or CP2102
(Depending on which accessory for usage.)

Step 2. Insert the converter to computer and confirm the “com port” in device manager

Step 3. Open the software(Minimu.exe)
Data will appear after auto-search finishes

Notice: If not successful, please operate manually
Choose the com port and baud rate 9600, data will be shown on the software.

2.3 Calibration

Preparation:

Make sure the sensor is "Online".

Calibration on PC software:

It is required to calibrate for the first time usage.

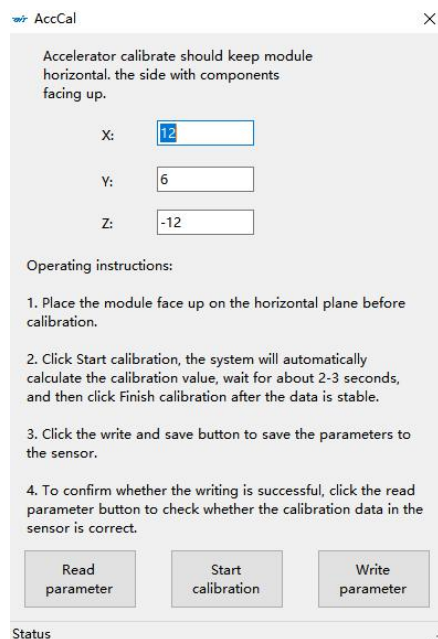

2.3.1 Accelerometer Calibration

Purpose:

The accelerometer calibration is used to remove the zero bias of the accelerometer. Before calibration, there will be different degrees of bias error. After calibration, the measurement will be accurate.

Methods:

- Step 1. Keep the module horizontally stationary
- Step 2. Click the accelerometer calibration
- Step 3. Click the "Start calibration" and wait for 3 seconds

The screenshot shows a software window titled "AccCal" with a close button (X) in the top right corner. The window contains the following text and controls:

Accelerator calibrate should keep module horizontal, the side with components facing up.

X:

Y:

Z:

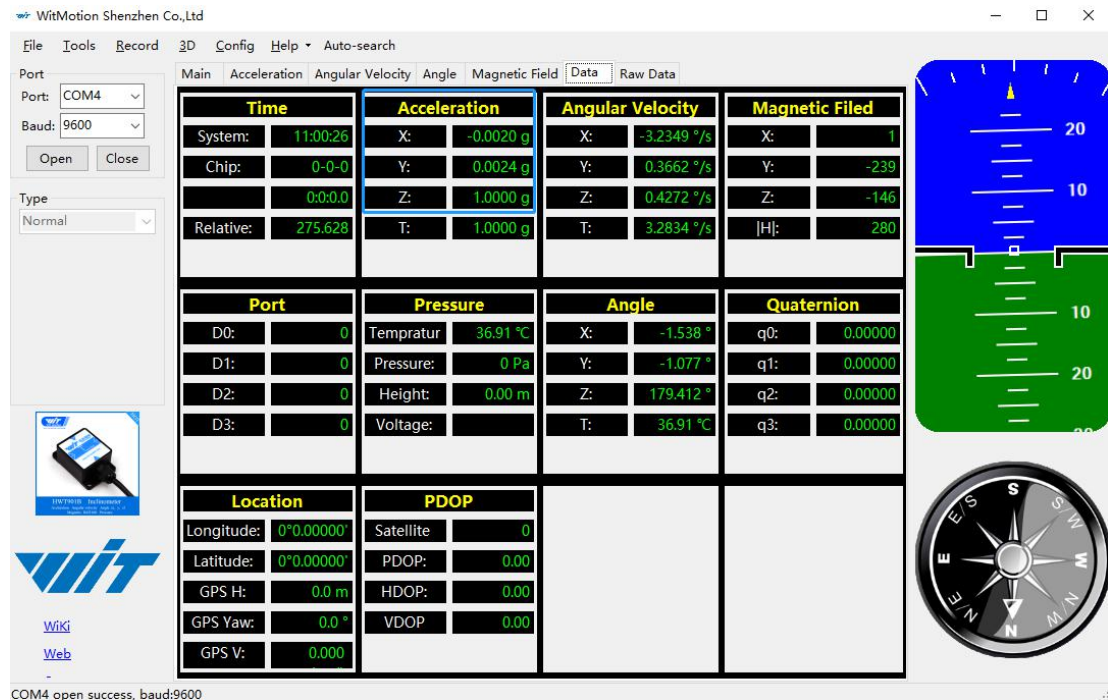

Operating instructions:

1. Place the module face up on the horizontal plane before calibration.
2. Click Start calibration, the system will automatically calculate the calibration value, wait for about 2-3 seconds, and then click Finish calibration after the data is stable.
3. Click the write and save button to save the parameters to the sensor.
4. To confirm whether the writing is successful, click the read parameter button to check whether the calibration data in the sensor is correct.

At the bottom, there are three buttons: "Read parameter", "Start calibration", and "Write parameter". Below the buttons is a "Status" label.

- Step 4. Click "Complete Calibration"

Step 5. Judge the result--confirm if there is 1g on Z-axis acceleration

1. After 1 ~ 2 seconds, the three axial acceleration value of the module is about 0, 0, 1, the X and Y axis Angle is around 0°. After calibration, the x-y axis Angle is accurate.

Note: When putting the module horizontal, there is 1g of gravitational acceleration on the Z-axis.

2.3.2 Magnetic Field Calibration

Purpose:

Magnetic calibration is used to remove the zero bias of the magnetic field sensor. Usually, the magnetic field sensor will have a large zero error when it is manufactured. If it is not calibrated, it will bring a large measurement error, which will affect the accuracy of the measurement of the z-axis Angle of the heading Angle.

Preparation:

Sensors should be 20CM away from magnetic and iron and other materials

Methods:

Step 1. Open the Config menu

Step 2. Click the magnetic field calibration button. click the “Start calibration”

Step 3. Slowly rotate the module 360° around X, Y, Z, 3-axis accordingly

Step 4. After rotation, click "End calibration"

Successful result:

Most of data dots will be within the ellipse.

If not successful, please stay away from the objective that can create magnetic field interference.

HWT905-RS232 | manual v0707 | <http://wiki.wit-motion.com/english>

2.3.3 Gyroscope Automatic Calibration

The gyroscope calibration is to calibrate the angular velocity, and the sensor will calibrate automatically.

It is recommended that the automatic calibration of gyroscopes can be inactivated only if the module rotates at a constant speed.

2.3.4 Reset Z-axis Angle

Note: If you want to avoid magnetic interference, you can change the algorithm to 6-axis, function of resetting Z-axis angle can be used.

The z-axis angle is an absolute angle, and it takes the northeast sky as the coordinate system can not be relative to 0 degree.

Z axis to 0 is to make the initial angle of the z axis angle is relative 0 degree. When the module is used before and z - axis drift is large, the z - axis can be calibrated, When the module is powered on, the Z axis will automatically return to 0.

Calibration methods as follow: firstly keep the module static, click the "Config" open the configuration bar and then click "Reset Z-axis Angle" option, you will see the the angle of the Z axis backs to 0 degree in the module data bar.

2.3.5 Reset Height to 0

Only available for the module built-in barometer like WT901B, HWT901B, WTGAHRS1, WTGAHRS2.

2.4 Configuration

2.4.1 Return Content

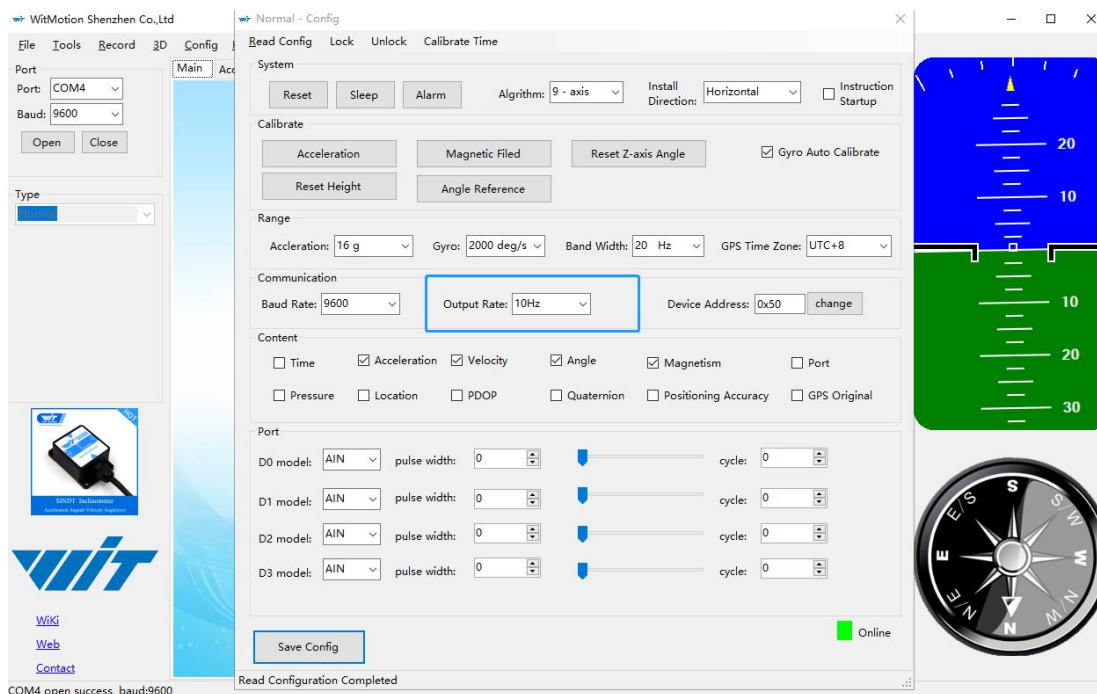

Setting method: The content of the data return can be set according to user needs, click the configuration option bar, and check the data content to be output.

Taking HWT905 as an example, the default output of the module is acceleration, angular velocity, angle, and magnetic field.

Notice: If choosing the GPS Original, there will be no other data output.

2.4.2 Output Rate

The default return rate of the module is 10Hz, the highest return rate supports 200Hz.

10Hz refers to the return of 10 data packets in 1S. 1 data packet is 33 bytes by default.

Note: If there are more backhaul contents and the communication baud rate is lower, it may not be possible to transmit so much data. Then the module will automatically reduce the frequency and output at the maximum allowable output rate. To put it simply, if the return rate is high, the baud rate should also be set higher, generally 115200.

2.4.3 Baud Rate

The module supports multiple baud rates, and the default baud rate is 9600. To set the baud rate of the module, you need to select the baud rate to be changed in the communication rate drop-down box in the configuration bar based on the correct connection between the software and the module.

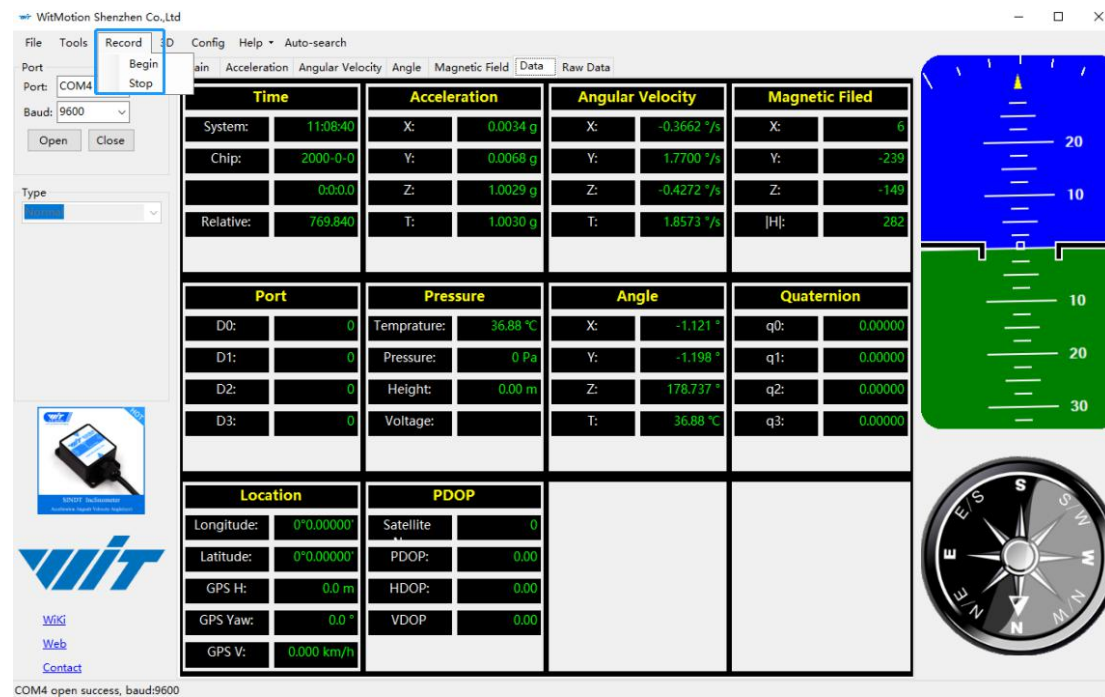

Note: After the change, the module will no longer output data at the original baud rate. The data will be output only when the baud rate that has been changed is selected on the PC software again.

2.4.4 Data Recording

Method are as follows:

Step 1: Click "Record" and "Begin"

Step 2: Click "Stop"

The screenshot shows the WitMotion software interface. On the left, there is a sidebar with a 'Record' button highlighted by a red box, and a 'Begin' button below it. The main area displays various sensor data in a grid format:

Time		Acceleration		Angular Velocity		Magnetic Field	
System:	11:08:40	X:	0.0034 g	X:	-0.3662 °/s	X:	6
Chip:	2000-0-0	Y:	0.0068 g	Y:	1.7700 °/s	Y:	-239
	0:0:0.0	Z:	1.0029 g	Z:	-0.4272 °/s	Z:	-149
Relative:	769.840	T:	1.0030 g	T:	1.8573 °/s	H :	282

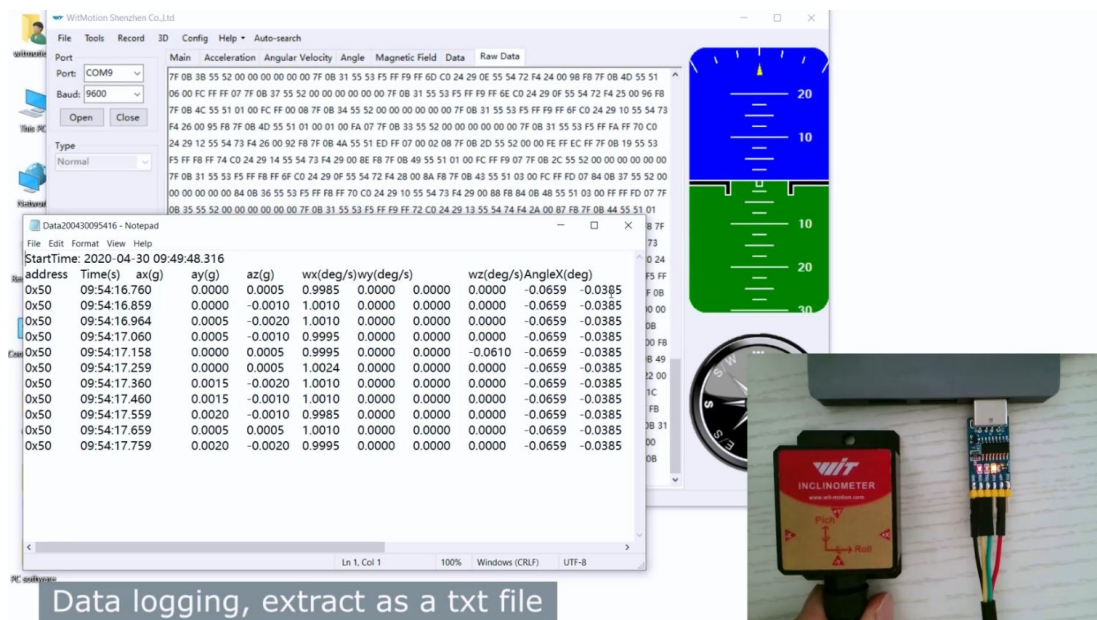

Port		Pressure		Angle		Quaternion	
D0:	0	Temperature:	36.88 °C	X:	-1.121 °	q0:	0.00000
D1:	0	Pressure:	0 Pa	Y:	-1.198 °	q1:	0.00000
D2:	0	Height:	0.00 m	Z:	178.737 °	q2:	0.00000
D3:	0	Voltage:		T:	36.88 °C	q3:	0.00000

Location		PDOP	
Longitude:	0°0.00000'	Satellite:	0
Latitude:	0°0.00000'	PDOP:	0.00
GPS H:	0.0 m	HDOP:	0.00
GPS Yaw:	0.0 °	VDOP:	0.00
GPS V:	0.000 km/h		

On the right side, there are two vertical scale indicators: a blue one with a yellow arrow pointing up and a green one with a white arrow pointing down. Below these is a compass rose showing cardinal and intercardinal directions (N, S, E, W, NE, SE, SW, NW).

At the bottom left, there is a status bar that reads: "COM4 open success, baud:9600".

Step 3: Extract the data as "txt" file

Notice: If there is repeated "TIME" of data, that's caused by low-resolution of the Windows system's time. The changes in other data is correct.

It is highly recommended that data can be pasted to a Excel file. In this way, all data will be shown in order.

2.4.5 Data Playback

New function: When creating recorded file each time, there will a BIN file created in the folder of record file in path of installed software meanwhile.

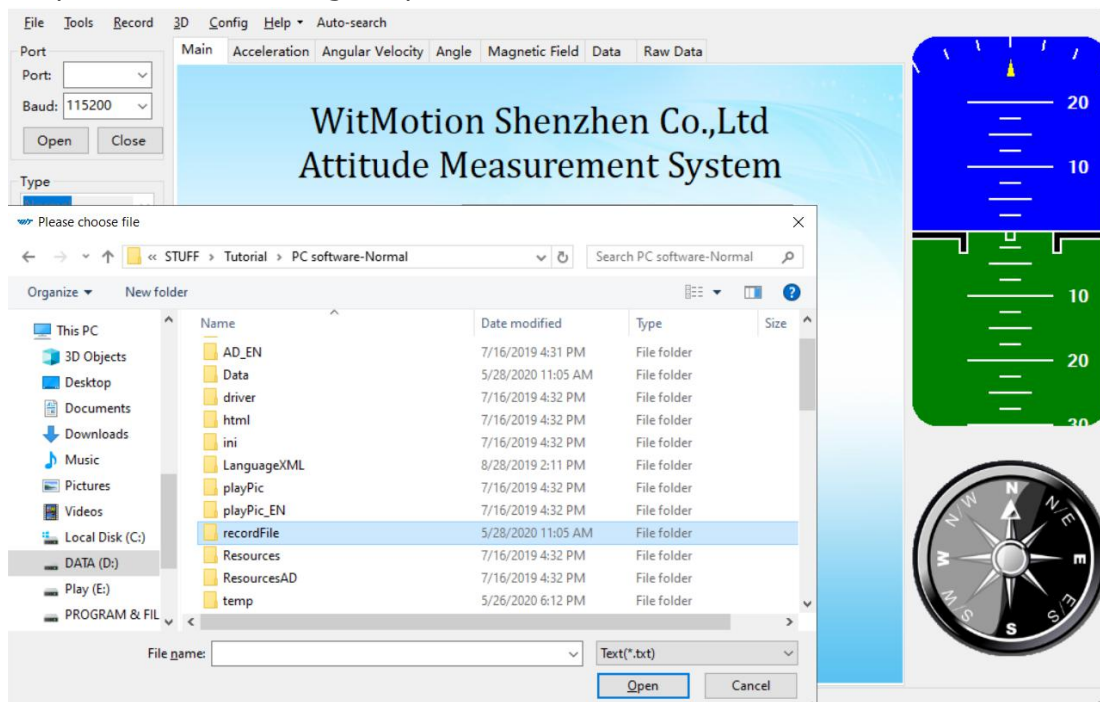

Recorded data playback method:

Step 1: Disconnect the sensor

Step 2: Click "File" Button and then click "Load"

Step 3: Choose the original path of software installation and load the Bin file

Step 4: Click "Run" and the Binary file will be playback
When playback, the rate can be editable.

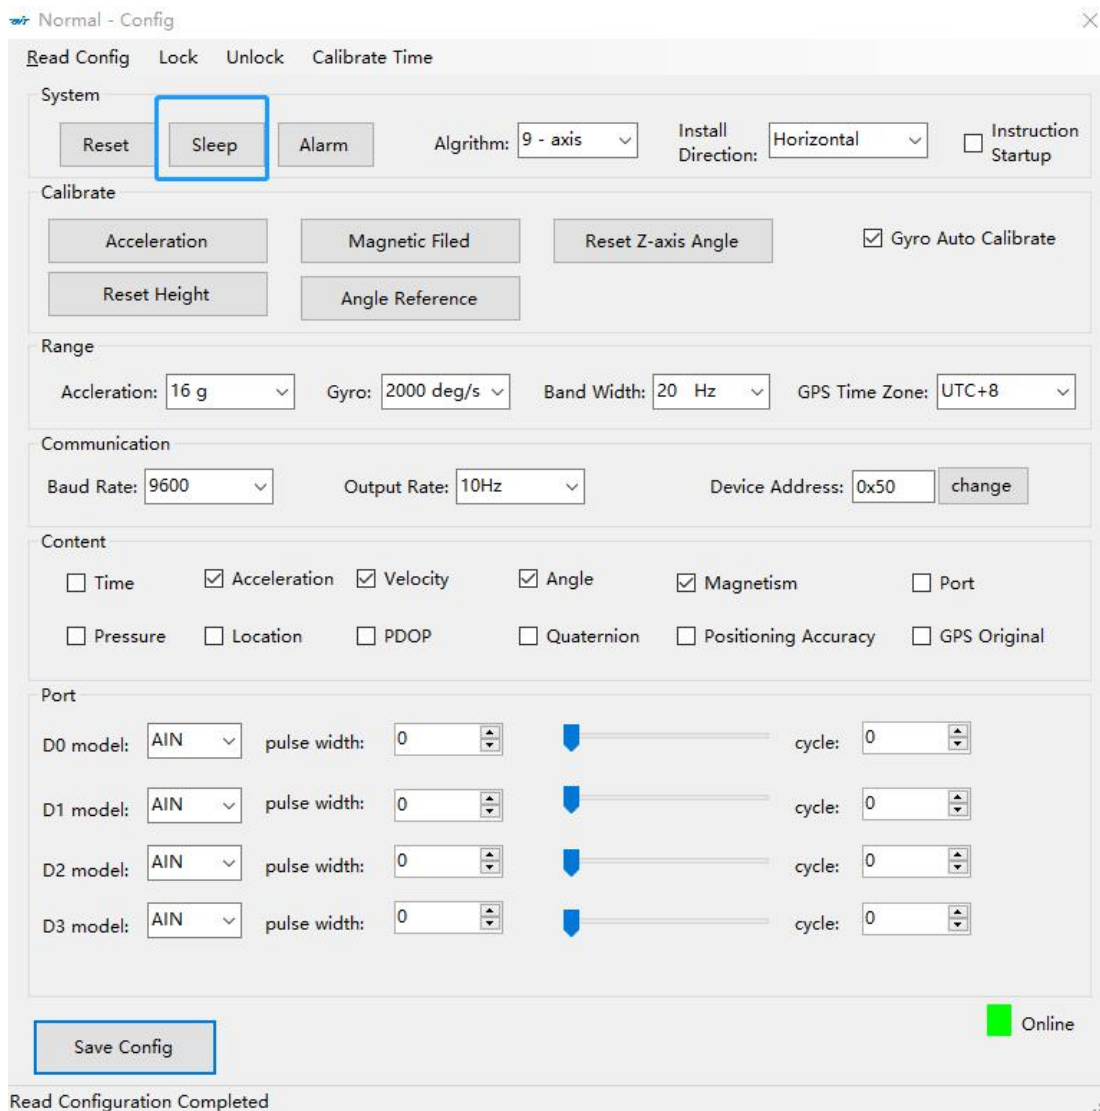

2.4.6 Standby and Wake Up

Sleep: The module paused working and entered the standby mode. Power consumption is reduced after sleeping.

Wake up: The module enters the working state from the standby state.

The module defaults to a working state, in the "Config" of the software, click "Sleep" option to enter the sleep state, click "Sleep" again to release sleep.

2.4.7 Placement Direction

The default installation direction of the module is horizontal. When the module needs to be installed vertically, the vertical installation can be set.

Step 1: Rotate the module 90 degrees around the X-axis

Step 2: Place the sensor 90 degrees vertically

Step 3: Click "Vertical" as install directions on "Config" menu

2.4.8 Bandwidth

Default bandwidth is 20Hz.

Function:

1. The higher rate of bandwidth setting will lead to the higher fluctuation in data waveform. Conversely, the lower rate of bandwidth, data will become more fluent.

For example:

Bandwidth as 20Hz, Output rate as 10Hz. The waveform is very steady.

Bandwidth as 256Hz, Output rate as 10Hz. The waveform will show more fluctuation.

2. The higher rate of bandwidth will solve the data-repeating problem.

For example, if the bandwidth setting is 20Hz, retrieval rate as 100Hz, there will be 5 repeating data.

If you prefer there is no repeating data, it is required to increase the bandwidth more than 100Hz.

2.4.9 Restore Factory Setting

Operation method:

Connect the HWT905 to the computer through the USB to serial port module, click the configuration option, open the configuration bar, and click "Reset".

After restoring the factory settings, power on the module again. (This method needs to know the baud rate of the module in advance, if the baud rate does not match the instruction will not take effect.)

2.4.10 6-axis/ 9-axis Algorithm

6-axis algorithm: Z-axis angle is mainly calculated based on angular velocity integral. There will be calculated error on Z-axis angle.

9-axis algorithm: Z-axis angle is mainly calculated and analyzed based on the magnetic field. Z-axis angle will have few drift.

The default algorithm of HWT905 is 9-axis. If there is magnetic field interference around installed environment, it is recommended to switch to 6-axis algorithm to detect the angle.

Method:

Step 1: Switch to the "6-axis" algorithm on "Config" menu

Step 2: Proceed the "Accelerometer calibration" and "Reset Z-axis angle" calibration.

After the calibration is completed, it can be used normally.
